

IRIS Security Console

*Workspace security – a
challenge without an answer*

Workspace security in iManage Work is not always straightforward, it is a dynamic process. Busy professionals carry full responsibility for the security of their projects, but do not have the time for heavy change management. Assigning project delegates enables the professional to still be in charge, but share the admin tasks.

THE IRIS ANSWER

The Security Console application provides iManage Work group management and workspace security management to users that normally are not allowed to do so, as by default iManage Work reserves those rights to adminis-

*“Specified users can add/
remove groups to/from
security on workspaces
without the requirement of
having “Full-Access”*

trators having access to the Database Administration tool only.

IRIS Security Console

Also, iManage Work allows workspace security changes for users that have “Full Access” rights by default. The Security Console allows specified users to add/remove groups to/from security on workspaces without the requirement of having “Full Access”. All these features are controlled by customer specific business rules. Adding groups and users can be (dis)allowed on all or specific workspace types.

Due to the detailed audit trail, professionals can view details of the workspace security, filtering and sorting per user, date or user. Admin users can prepare reports on security on specific dates. Clients can request historical information on workspaces and users.

KEY FEATURES

- Group membership management by key users on a workspace (e.g. partner, manager);
- Select delegate users to handle the security management;
- Full audit trail on workspace and group security changes.

REQUIREMENTS

- iManage Work 9.0 (or higher);
- SQL Server 2012 or higher.
